

Network Maintenance Guidelines

1. Scheduled Maintenance

Network maintenance windows are scheduled weekly from 1:00 AM to 4:00 AM on Sundays. Notifications are sent to affected customers 48 hours in advance.

2. Maintenance Frequency

Critical network components must be serviced at least every 90 days. Logs of maintenance actions are recorded.

3. Emergency Procedures

Emergency maintenance can be performed outside scheduled windows in case of outages or security threats. These require approval by the network operations manager.

4. Maintenance Documentation

All maintenance activities must be documented including date, personnel, actions taken, and issues found.

5. Equipment Replacement

Equipment nearing end-of-life must be replaced proactively. Replacement criteria include age above 5 years or failure rates exceeding 2% per month.

6. Quality Assurance Checks

Post-maintenance testing includes uptime verification, performance benchmarking, and security scans.

7. Maintenance Team Training

Network technicians must complete quarterly training on new technologies, safety standards, and troubleshooting.
